Mining makes wind power generation possible

29 Windfarms

More than 220 tonnes of coal is required to build a wind turbine.

Wind power across Australia

Windfarms generated 12,700 gigawatt hours of electricity across Australia in 2017 – enough to power over two million homes. More than 5,600 megawatts of wind capacity is now connected to the grid, with wind generation accounting for around 5 per cent of Australia's total electricity generation.
